

OCR Document — Multi-Document Search Test

Optical Character Recognition

Optical Character Recognition (OCR) converts text contained in scanned images and scanned documents into machine-readable text. OCR is useful when a PDF does not contain an accessible text layer.

OCR Pipeline

A typical OCR pipeline includes image acquisition, preprocessing, text recognition, text cleaning, normalization, and storage. The cleaned text can then be divided into chunks for semantic search.

Enterprise Use

Enterprise knowledge assistants use OCR to make scanned invoices, reports, forms, manuals, and archived documents searchable. OCR therefore connects image-based documents with downstream retrieval systems.
